

# TTS Sustainability Initiatives

By continuously developing and providing solutions that incorporate the latest technologies and concepts, we will boldly take on the challenge of solving ever-changing customer and market issues.

We also aim for a sustainable society and will make a lasting contribution to society through our business and the means available to us as a company.

## SUSTAINABLE DEVELOPMENT GOALS

## Further improvement of energy efficiency

By consolidating each facility and power information of numerous mega solar power plants (large-scale solar power plants) into one platform, the operation status and power generation amount of various facilities that differ depending on the site can be monitored and controlled on a common screen in real time, contributing to system construction at low cost and in a short period of time. With the aim of minimizing the environmental impact of manufacturing products and providing services, we will continue to improve energy efficiency through technological development.
